Foreword

The world is facing unprecedented challenges, from climate change and environmental degradation to food security and socio-economic disparities. In this context, agroforestry has emerged as a powerful solution that integrates trees into agricultural landscapes, offering a pathway toward sustainable land use, enhanced biodiversity, and improved livelihoods. At the heart of this dynamic system are agroforestry tree genetic resources (ATGR)—the foundation of ecological resilience and agricultural productivity. However, these resources are under constant threat from deforestation, habitat loss, climate change, and unsustainable harvesting practices. The protection, conservation, and sustainable use of agroforestry tree genetic resources are paramount for future generations to benefit from their ecological, economic, and social advantages. It is therefore vital to build a collaborative framework that unites policymakers, researchers, communities, and industry stakeholders to prioritize the management and sustainable utilization of these resources. This document aims to highlight the importance of agroforestry tree genetic resources, their role in sustainable development, and the imperative need for their conservation and strategic use. It is our collective responsibility to ensure that these vital resources continue to enrich ecosystems and support communities around the world. Let us recognize the immense potential and value of agroforestry tree genetic resources and take decisive action to protect and nurture them for a sustainable and equitable future.

(S.K. Chaudhari)
Deputy Director General (NRM)
Indian Council of Agricultural Research
New Delhi

Preface

Agroforestry tree genetic resources are far more than just the genetic building blocks of trees. They represent an invaluable source of traits that contribute to resilience, adaptation, and productivity. These traits include drought and disease resistance, rapid growth, high-quality timber, nutritious fruit, and more. The genetic diversity within ATGR is vital for ensuring that agroforestry systems can adapt to the ever-changing challenges posed by climate change, shifting agricultural needs, and the pressures of global food security. However, these resources are under threat from factors such as habitat loss, deforestation, climate change, and unsustainable management practices. The loss of genetic diversity within tree populations can significantly undermine the ecological and economic benefits that agroforestry provides. As such, it is crucial to recognize and address the need for comprehensive management, conservation, and sustainable use of these resources to safeguard the long-term health of agroforestry systems and the livelihoods of millions who depend on them. This publication aims to illuminate the importance of agroforestry tree genetic resources, exploring their role in ecosystem resilience, agricultural productivity, and community wellbeing. It also underscores the critical need for conservation efforts that not only protect these resources but actively promote their sustainable utilization. Through a synthesis of research, case studies, and best practices, we hope to inspire action and collaboration among stakeholders at all levels - from local farmers and indigenous communities to policymakers and international organizations.

We invite you to explore the insights shared in these pages, deepen your understanding of the value of agroforestry tree genetic resources, and join in the collective effort to preserve and utilize them sustainably. Let this document serve as a reminder of the immense potential these resources hold for ensuring a sustainable, resilient, and equitable future for all.

About ICAR-Central Agroforestry Research Institute

ICAR-Central Agroforestry Research Institute (ICAR-CAFRI), formerly the National Research Centre for Agroforestry, is a multidisciplinary premier research institute of the Indian Council of Agricultural Research (ICAR) with a major focus on integrating trees, crops and livestock on the same farmland. The Institute is in Jhansi, Uttar Pradesh (25.5° N 78.5° E), India and has a total area of 254.859 acre. CAFRI is the only dedicated research institute of the country working on key research areas of agroforestry and has developed robust agroforestry models and package of practices for different agroclimatic conditions covering small and marginal farmers and provides technical backstopping to the States and stakeholders. In the year 2023, the Institute has been notified as the National Nodal Agency for Agroforestry with mandated activities of setting standards for quality planting material, nursery accreditation, seedling certification, capacity building of stakeholders, technical backstopping of State departments for implementation of agroforestry programs and projects.

History

ICAR initiated a network project for organized research in 1983 i.e., All India Coordinated Research Project on Agroforestry. After successful 5 years, the Council institutionalized the Project as a National Research Centre for Agroforestry (NRCAF) on the 8th May 1988. The Institute is now renamed as Central Agroforestry Research Institute (CAFRI).

Vision

To improve the quality of life of rural people by integrating perennial crops in agricultural landscape for harnessing social, economic and environmental benefits.

Mission

Integration of woody perennials in the farming system to improve land productivity through conservation of soils, nutrients and biodiversity by augmenting natural resource conservation, restoration of ecological balance, alleviation of poverty and mitigating risks of weather vagaries.

2

Agroforestry Tree Genetic Resources (ARGR)

Agroforestry is a land use system that integrates woody-perennial (trees and shrubs) into crop and animal production systems. This approach enhances both productivity and environmental sustainability. Agroforestry tree genetic resources (ATGR) refer to the diverse genetic material found in tree species that are utilized in agroforestry systems. These resources are essential for maintaining and improving the productivity, resilience, and adaptability of these systems. Agroforestry tree genetic resources encompass the genes, traits, and diversity within tree species that contribute to ecological balance, soil fertility, crop productivity, and income generation for communities. This genetic diversity is critical for improving tree resilience to pests, diseases, climate variability, and other stressors. It also supports ecological functions like carbon sequestration, water cycle regulation, and biodiversity conservation. Agroforestry incorporates a wide range of tree types, which include, fruit and nut trees, timber and fuelwood trees, nitrogen-fixing trees, and multipurpose trees. Genetic diversity is key to sustaining agroforestry systems. In any population of trees, genetic variation can lead to different characteristics, such as resistance to diseases, faster growth rates, and better adaptation to different climates. Conservation of these genetic resources is critical for ensuring that future generations can benefit from their use. Strategies include, *In situ* conservation as preserving trees within their natural habitat or in managed agroforestry systems. *Ex situ* conservation as storing seeds, cuttings, or plant material in seed banks and nurseries for later use. Also, agroforestry trees play a pivotal role in mitigating climate change. They absorb carbon dioxide from the atmosphere, contribute to carbon storage in soils, and help maintain a balanced ecosystem. Genetic resources that are well-adapted to local conditions can increase the resilience of agroforestry systems to climate change impacts, such as droughts and temperature fluctuations. Research on agroforestry tree genetic resources focuses on; 1. Improving productivity through breeding programs that enhance desirable traits like disease resistance, drought tolerance, and high yield. 2. Selection of native species using local tree species that have co-evolved with their environments to ensure ecological compatibility and sustainability. 3. Clonal propagation as multiplying superior genetic material through cloning to maintain uniformity and desired traits. These agroforestry tree genetic resources face several challenges including, deforestation and land conversion, climate change, over harvesting, and pests and diseases. Therefore, the conservation strategies should integrate traditional knowledge and modern scientific approaches. Involving local communities in managing and preserving tree genetic

resources helps ensure that the resources are used sustainably and maintained for future generations. Certification schemes and agroforestry incentives can support the sustainable use of these resources. As a whole, agroforestry tree genetic resources are indispensable for the success of agroforestry systems. Their preservation and sustainable use help ensure food security, economic stability, and environmental health. Research and collaborative conservation efforts among scientists, policymakers, and local communities are essential for managing and maintaining these resources for current and future needs.

What are tree genetic resources?

Tree genetic resources refer to the heritable material found in trees that can be passed from one generation to the next, including the genetic diversity within tree species and populations. This genetic material is essential for the growth, adaptation, and survival of trees in different environments. It encompasses the full range of variation within a species or among species, including traits like disease resistance, growth rate, wood quality, and adaptability to different climatic and soil conditions.

Why tree genetic resources are important

1. Biodiversity Conservation:

- **Ecological Balance:** Tree genetic resources are fundamental for maintaining biodiversity in forest ecosystems. They contribute to the stability of natural environments by supporting diverse plant and animal species.
- **Habitat Provision:** Trees with varied genetic traits create diverse habitats for wildlife, promoting a rich ecosystem.

2. Climate Change Mitigation and Adaptation:

- **Carbon Sequestration:** Trees play a crucial role in absorbing carbon dioxide, a major greenhouse gas. Genetic diversity in tree species can enhance their ability to adapt to changing climates and continue to sequester carbon effectively.
- **Adaptability to Climate Variability:** Genetic resources that offer traits such as drought resistance, heat tolerance, and resilience to extreme weather help ecosystems and human communities adapt to climate change.

3. Sustainable Timber and Non-Timber Products:

- **Economic Benefits:** Tree genetic resources ensure a steady supply of high-quality timber, which is used in construction and furniture production, contributing to economic stability.
- **Non-Timber Forest Products:** Trees also provide various products such as fruits, nuts, resins, medicinal compounds, and oils. The genetic diversity of tree species helps maintain the availability and quality of these products.

4. Soil and Water Conservation:

- **Soil Health:** Trees contribute to soil stabilization and fertility. Tree roots prevent soil erosion, reduce runoff, and help maintain soil structure, contributing to better land productivity.
- **Water Cycle Regulation:** Tree genetic resources help maintain the water cycle by influencing groundwater recharge and water storage. Certain tree species can effectively control watershed dynamics and improve water quality.

5. Resilience to Pests and Diseases:

- **Disease Resistance:** Genetic variation within tree species can include traits that make them more resistant to pests and diseases. This is important for preventing the spread of invasive species that can damage entire ecosystems and affect human livelihoods.
- **Diverse Resistance Mechanisms:** The greater the genetic diversity, the higher the likelihood of having trees that can survive new or emerging threats.

6. Food Security and Nutrition:

- **Edible Fruits and Nuts:** Trees provide essential food sources, contributing to food security. The genetic variation among fruit and nut trees ensures a diverse diet and helps combat malnutrition.
- **Nutrient-Rich Species:** Certain trees have high levels of vitamins and minerals (e.g., *Moringa*), providing nutritional benefits, particularly in regions with limited access to other food sources.

7. Cultural and Social Significance:

- **Cultural Heritage:** Many tree species have cultural or spiritual significance to indigenous and local communities. Protecting these genetic resources helps preserve traditional practices, knowledge, and cultural heritage.
- **Community Wellbeing:** Trees contribute to better living environments, shade, and recreational spaces, enhancing community health and quality of life.

8. Potential for Future Use:

- **Biotechnology and Breeding:** Tree genetic resources are a source of traits that can be harnessed through breeding and biotechnological advancements. This can lead to the development of trees that are more productive, better adapted to local climates, and more resistant to diseases.
- **Novel gene discovery:** Continued research into tree genetic resources may reveal novel compounds and genetic traits with potential uses in medicine, biochemistry, and industry.

Tree genetic resource management and utilization

It involve strategies and practices aimed at conserving, maintaining, and leveraging the genetic diversity found in trees for sustainable use and development. Proper management and utilization ensure that tree genetic resources remain available and viable for future generations, providing ecological, economic, and social benefits.

Management of Tree Genetic Resources

Tree genetic resource management focuses on maintaining and enhancing the diversity, health, and abundance of tree species and their genetic material. This management can be classified into several strategies:

a. Conservation Strategies

- **In Situ Conservation:** This involves conserving tree genetic resources within their natural habitats or in managed ecosystems like agroforestry and community forests. It helps maintain natural gene flow and ensures that trees adapt to local environmental conditions over generations.
- **Ex Situ Conservation:** This method stores tree genetic resources outside their natural habitat, such as in seed banks, nurseries, botanical gardens, and tissue culture laboratories. This provides a safety net for species at risk of extinction or those whose natural habitats are threatened.
- **Protected Areas and Reserves:** Establishing national parks, nature reserves, and protected forests where tree species can thrive without human interference.
- **Community Involvement:** Involving local communities in the conservation process ensures that the knowledge and traditions related to tree management are preserved and respected.

b. Sustainable Management Practices

- **Agroforestry and Silvopasture:** Integrating trees with crops and livestock helps maintain soil fertility, conserve water, and support biodiversity while providing food, fuel, and income for communities.
- **Sustainable Harvesting:** Implementing guidelines for the responsible collection of seeds, wood, and other tree products prevents overharvesting and ensures that tree populations remain healthy and viable.

c. Monitoring and Research

- **Genetic Mapping and Monitoring:** Regularly tracking the health, diversity, and distribution of tree species through genetic mapping and field surveys.
- **Climate Adaptation Studies:** Understanding how different tree species respond to changing climate conditions is essential for managing genetic resources that are resilient to such changes.

- **Genomic Research:** Advanced genetic techniques, including DNA sequencing, help identify beneficial traits within tree populations, such as drought tolerance, pest resistance, and fast growth rates.

Utilization of Tree Genetic Resources

Utilization refers to the practical application of tree genetic resources to enhance productivity, restore ecosystems, and support community needs. Sustainable utilization involves balancing current use with future conservation.

a. Improved Tree Breeding and Propagation

- **Selective Breeding:** Selecting and breeding trees with desirable traits, such as disease resistance or higher yield, can create improved varieties that benefit farmers and industries.
- **Clonal Propagation:** Using techniques like grafting and tissue culture to propagate superior tree varieties with consistent genetic traits.
- **Hybridization:** Cross-breeding different tree species or varieties to combine beneficial traits from each, improving overall performance and resilience.

b. Value-Added Products

- **Timber and Wood Products:** Utilizing tree genetic resources to produce high-quality timber for construction, furniture, and other industries. Selecting specific genetic strains can yield wood that is more durable, lightweight, or aesthetically appealing.
- **Non-Timber Forest Products (NTFPs):** Trees provide various NTFPs like fruits, nuts, resins, oils, medicinal plants, and fibers. Sustainable harvesting and management ensure these resources contribute to food security and local economies.
- **Pharmaceuticals and Bioproducts:** Trees produce a wealth of bioactive compounds used in medicine and cosmetics. For instance, species like *Moringa* and *Neem* have a variety of health-related properties.
- **Ecological Services:** Trees are valuable for ecosystem services such as carbon sequestration, air and water purification, and habitat provision. Leveraging these services through carbon credits and eco-tourism provides economic incentives while promoting environmental sustainability.

c. Community and Socioeconomic Development

- **Agroforestry and Livelihoods:** Utilizing tree genetic resources within agroforestry systems helps diversify income sources, promote food security, and create employment opportunities in rural areas.

- **Cultural and Traditional Uses:** Many trees have cultural significance, providing traditional medicine, spiritual importance, and resources for cultural practices.
- **Education and Capacity Building:** Teaching communities about the benefits and sustainable management of tree genetic resources can improve local stewardship and enhance conservation efforts.

Challenges in Tree Genetic Resource Management and Utilization

- **Climate Change:** Changes in climate can disrupt the natural range of tree species, affecting their genetic diversity and resilience.
- **Deforestation and Land Conversion:** The conversion of forests to agriculture or urban areas reduces natural habitats and limits the availability of tree genetic resources.
- **Overharvesting and Unsustainable Practices:** Unsustainable logging and collection of tree products can deplete populations and impact ecosystem health.
- **Pests and Diseases:** Emerging threats from pests and pathogens can significantly impact tree genetic diversity and productivity.
- **Limited Funding and Policy Support:** Adequate funding and effective policies are necessary for the successful management and conservation of tree genetic resources.

Future Directions and Best Practices

- **Collaborative Approaches:** Collaboration between governments, NGOs, researchers, and local communities can support more effective management and utilization of tree genetic resources.
- **Integration of Modern Technology:** Using GIS mapping, remote sensing, and genetic engineering can improve monitoring, breeding, and conservation practices.
- **Policy and Legal Frameworks:** Strengthening legal frameworks for the protection and sustainable use of tree genetic resources, including enforcing sustainable land use and conservation laws.

Name of the species: *Acacia nilotica*

S.No.	Name of the species	Germplasm No.	Place of collection/exploration	IC No.
1	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Patoda	-
2	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Parali	-
3	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Ambejogai	-
4	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Beed	-
5	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Gangakhed	-
6	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Jamkhed	-
7	<i>Acacia nilotica</i> var. <i>cuperessiformis</i>	-	Dhamori	-

19	<i>Acacia nilotica</i> var. cuperessiformis	-	Nandgaon	-
20	<i>Acacia nilotica</i> var. cuperessiformis	-	Chas	-
21	<i>Acacia nilotica</i> var. cuperessiformis	-	Rahur	-

Name of the species: *Azadirachta indica*

S.No.	Name of the species	Place of collection/exploration	Germplasm No.	IC No.
1	<i>Azadirachta indica</i>	Waghunde (A. Nagar)	-	-
2	<i>Azadirachta indica</i>	Ghavanwadi	-	-
3	<i>Azadirachta indica</i>	Karde (Pune)	-	-
4	<i>Azadirachta indica</i>	Someshwar	-	-
5	<i>Azadirachta indica</i>	Tambve (Satara)	-	-
6	<i>Azadirachta indica</i>	Watharst.	-	-
7	<i>Azadirachta indica</i>	Bamrmati (Pune)	-	-
8	<i>Azadirachta indica</i>	Agra Road (Dhule)	-	-
9	<i>Azadirachta indica</i>	Bhambertanda (Sambhaji Nagar)	-	-
10	<i>Azadirachta indica</i>	Hatnur road (Sambhaji Nagar)	-	-

Name of the species: *Bamboo spp.*

S.No.	Name of the species	Germplasm No.	Place of collection/exploration	IC No
1	Bamboo	-	AICRP, Rahuri	-
2	<i>Bambusa affinis</i>	-	AICRP, Rahuri	-
3	<i>Bambusa burmanica</i>	-	AICRP, Rahuri	-
4	<i>Bambusa Striata</i>	-	AICRP, Rahuri	-
5	<i>Dendrocalamus longispathus</i>	-	AICRP, Rahuri	-
6	<i>Dendrocalamus membranaceus</i>	-	AICRP, Rahuri	-
7	<i>Bambusa multiplex</i>	-	AICRP, Rahuri	-
8	<i>Dendrocalamus sikkimensis</i>	-	AICRP, Rahuri	-
9	<i>Phyllostachys mannii</i>	-	AICRP, Rahuri	-
10	<i>Melocanna baccifera</i>	-	AICRP, Rahuri	-

11	<i>Phyllostachys aurea</i>	-	AICRP, Rahuri	-
12	<i>Shibatacakumasca</i>	-	AICRP, Rahuri	-
13	<i>Bambusa vulgaris</i>	-	AICRP, Rahuri	-
14	<i>Pseudosasa japonica</i>	-	AICRP, Rahuri	-
15	<i>Guadua angustifolia</i>	-	AICRP, Rahuri	-
16	<i>Dendrocalamus asper</i>	-	AICRP, Rahuri	-
17	<i>Bambusa nutans</i>	-	AICRP, Rahuri	-
18	<i>Oxytenantheraabyssinica</i>	-	AICRP, Rahuri	-
19	<i>Bambusa polymorpha</i>	-	AICRP, Rahuri	-
20	<i>Bambusa cacharensis</i>	-	AICRP, Rahuri	-
21	<i>Oxytenanthera parvifolia</i>	-	AICRP, Rahuri	-
22	<i>Guadua angustifolia</i>	-	AICRP, Rahuri	-
23	<i>Sehizostachyumpgracile</i>	-	AICRP, Rahuri	-
24	<i>Sasa fortunei</i>	-	AICRP, Rahuri	-
25	<i>Sehizostachiyumdullooa</i>	-	AICRP, Rahuri	-
26	<i>Bambusa wamin</i>	-	AICRP, Rahuri	-
27	<i>Bambusa tulda</i> var. <i>striata</i>	-	AICRP, Rahuri	-
28	<i>Bambusa bambos</i> var. <i>gigantea</i>	-	AICRP, Rahuri	-
29	<i>Bambusa tulda</i>	-	AICRP, Rahuri	-
30	<i>Dendrocalamus asper</i>	-	AICRP, Rahuri	-
31	<i>Dendrocalamus brandisii</i>	-	AICRP, Rahuri	-
32	<i>Dendrocalamus hamiltonii</i>	-	AICRP, Rahuri	-
33	<i>Dendrocalamus strictus</i>	-	AICRP, Rahuri	-
34	<i>Bambusa bamboo</i>	-	AICRP, Rahuri	-
35	<i>Dendrocalamus brandissi</i>	-	AICRP, Rahuri	-
36	<i>Bambusa balcooa</i>	-	AICRP, Rahuri	-
